No. 19 the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Consortium/LLNL at: http://image.llnl.gov Scries: IRAL Plate: 37 Row: g Column: 11
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 15718678
This clone has the following problem: frame shifted.

Sequences CC derived from beta c cDNA clone is used for screening and cloning a liver activin beta e gene. Disorders of cell growth or differentiation (or CC susceptibility to them) are diagnosed by measuring liver activin gene CC activity or by detecting a mutation in the liver activin gene Disorders CC maturation, hormone secretion, neuronal survival, spermatogenesis, bone formation, insulin secretion or cardiac morphogenesis are some conditions CC that can be diagnosed using the liver activin. Cell growth and CC compound or agent that upregulates the compound's expression. Antagonists CC can be used to treat liver diseases while agonists can be used to compound may also induce bone growth (e.g. for treating haemophilia, cystic fibrosis or menstrual disorders. Antibodies are useful in immunoassays, to generate anti-idiotypic antibodies (which to liver activin receptors) and to inhibit liver activin. Also, transgenic animals containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins, or the transgenic animals, are useful for screening for liver activin.

                                                                                                                                                                                                                                         A cDNA library prepared using total RNA from human liver was subjected to PCR amplification using primers corresp. to conserved regions within the TGF-beta family. Amplification products were subcloned and sequenced: one clone (designated pKK-MP121) was found to contain a new sequence. Part of the insert from the clone was used to re-screen the human liver cDNA library and a 2272 bp fragment coding for a TGF-beta-like protein (i.e. the present sequence) was isolated. This protein has mitrogenic and differentiation-inducing properties making it (or fusion proteins comprising it or heterodimers of the protein with a cystine knot motif protein) useful for inducing tissue regeneration, e.g. for wound healing, inducing growth of health of the protein with a cystine knot motif protein is trustific.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş
The present invention describes a protein (I) selected from the members of the transforming growth factor-beta (TGF-beta) superfamily, which is CC monomeric due to substitution or deletion of a cysteine which is CC (II) encoding (I); (2) expression vector (III) containing (II) in a CC guitable vector system; (3) host cell (IV) containing (II) capable of CC producing (I); and (4) a pharmaceutical composition (V) containing (I), CC (II), (III) or (IV). (I) has vulnerary, antiulcer, nootropic, and can be CC used in gene therapy. (V) is useful for the prevention or therapy of CC diseases for which also the dimeric form of the protein would be indicated. Diseases treatable include diseases associated with bone and/or cartilage damage or affecting bone and/or cartilage disease or concluding tendon and/or ligament, periodontal or dental tissue including including tendon and/or ligament, periodontal or dental tissue including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; transforming growth factor-beta; monomeric protein; MP52; MP121; dimeric protein; TGF-beta; vulnerary; antillicer; nootropic; neuroprotective; antilnfertility; osteopathic; gene therapy; bone; cartilage; dental; wound healing; connective tissue.

It can be obtd. by expression of a CDNA clone (AAT16883) derived from adult liver in transformed host cells. GDF-12 possesses activities that will make it useful in the treatment of liver disorders, e.g. disease states in which liver function is compromised, or cellular proliferative disorders such as hepatocellular carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

Human liver activin beta e polypeptide.

```
This represents a human liver activin beta e polypeptide. The invention CC provides murine beta c and beta e polypeptides and the encoding genes. CC Disorders of cell growth or differentiation (or susceptibility to them) CC are diagnosed by measuring liver activin gene activity or by detecting a CC mutation in the liver activin gene. Disorders of haematopoiesis, CC erythroid differentiation, ovarian follicular maturation, hormone consecretion or cardiac morphogenesis are some conditions that can be CC diagnosed using the liver activin. Cell growth and differentiation can be CC diagnosed using the liver activin. Cell growth and differentiation can be CC upregulates the compound's expression. Antagonists can be used to treat CC upregulates the compound's expression. Antagonists can be used to treat compound compound or agent that CC upregulates while agonists can be used to increase growth and compound compoun

Disorders CC of haematopolesis, erythroid differentiation, ovarian follicular CC maturation, hormone secretion, neuronal survival, spermatogenesis, bone CC formation, insulin secretion or cardiac morphogenesis are some conditions CC that can be diagnosed using the liver activin. Cell growth and CC compound or agent that upregulates the compound's expression. Antagonists CC can be used to treat liver diseases while agonists can be used to constead in the growth of liver tissue. The liver activin CC compound may also induce bone growth (e.g. for treating baemophilia, cystic fibrosis or menstrual disorders, antibodies are useful in immunoassays, to generate anti-idiotypic antibodies (which CC transgenic animals containing liver activin gene can be used to produce the liver activin (in correctly processed and modified forms) proteins, cc modulators.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This represents a murine liver activin beta e polypeptide. Sequences derived from a beta c cDNA clone is used for screening and cloning the activin beta e gene. Disorders of cell growth or differentiation (or susceptibility to them) are diagnosed by measuring liver activin gene

Also claimed are non chromosomal DNA encoding inhibin-alpha or an inhibin-beta chain. Sequencing of inhibin-encoding cDNA has led to the identification of prodomain regions located N-terminal to the mature inhibin chains that represent coordinately expressed biologically active polypeptides. The prodomain regions or

Mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFS, are claimed. The CKGF superfamily comprises at least four families of growth factors: the glycoprotein hormones, the platelet-derived growth factor (PDGF) family,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the wild type human activin B subunit. Mutants comprise at least one electrostatic charge altering mutation in a beta hairpin loop, resulting in increased bioactivity.

Mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFS, are claimed. The CKGF superfamily comprises at least four families of growth factors; the glycoprotein hormones, the platelet-derived growth factor (PDGF) family, the neurotrophins and the transforming growth factor beta family; the families are known to be structurally similar (especially comprising the cystine knot topology) and it was shown that mutations at certain positions in the CKGF hairpin loops of family members and other members activities of the CKGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mutant transforming growth factor family proteins or analogues are useful for treatment of ovulatory dysfunction, luteal phase defect, unexplained

                               A compsn. comprising human or porcine inhibin which is completely free of unidentified or porcine proteins is claimed. Also claimed are non chromosomal DNA encoding inhibin-alpha or an inhibin-beta chain. Sequencing of inhibin-encoding cDNA has led to the identification of prodomain regions located N-terminal to the mature inhibin chains that represent coordinately expressed biologically active polypeptides. The prodomain regions or prodomain immunogens are useful in monitoring preproinhibin processing in transformant cell culture or in experiments directed at modulating the climical condt. or reproductive physiology of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A compsn. comprising human or porcine inhibin which is completely free of unidentified or porcine proteins is claimed. Also claimed are non chromosomal DNA encoding inhibin-alpha or an inhibin-beta chain. Sequencing of inhibin-necoding cDNA has led to the identification of prodomain regions located N-terminal to the mature inhibin chains that represent coordinately expressed biologically active polypeptides. The prodomain regions or biologically active polypeptides. The prodomain regions or prodomain immunogens are useful in monitoring preproinhibin processing in transformant cell culture or in experiments directed at modulating the climical condt. or reproductive physiology of animals

                                                                                                                                                                                                                                                                                                                                                                                                      This is the wild type human inhibin A beta subunit. Mutants comprise at least one electrostatic charge altering mutation in a beta hairpin loop, resulting in increased bloactivity.

Mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological superfamily comprises at least four familes of growth factors: the glycoprotein hormones, the platelet-derived growth factor (PDGF) family, families are known to be structurally similar (especially comprising the positions in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFs, are claimed. The CKGF superfamily comprises at least four families of growth factors: the glycoprotein hormones, the platelet-derived growth factor (pDGF) family, the neurotrophins and the transforming growth factor beta family; the families are known to be structurally similar (especially comprising the cystine knot copology) and it was shown that mutations at certain positions in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the wild type human activin A subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 313; Page 304; 320pp; English.
